

## Short Dose response explorer (DRE) guide

### **Features**

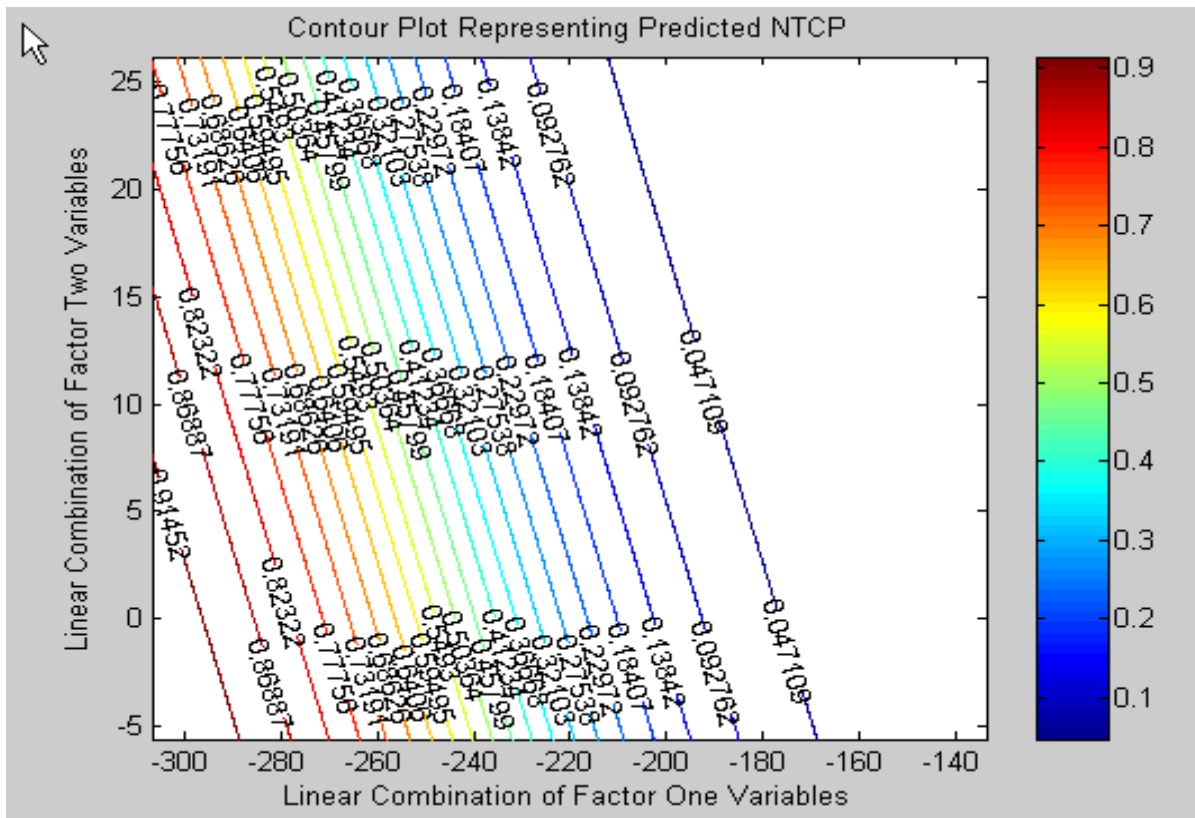

1. Selection of variables in two factor groups
  - Allows user to see a combination of variables on either/both X-axis or Y-axis.  
Note: Multiple values for V(x) and D(x) can be selected
  - Does not allow Variables to be selected twice
2. Logistic Regression Model is applied
  - Coefficient values (B) and their significance (p-values based on Wald statistics) are computed for each variable
  - Sample size (n) and Spearman rank correlation are provided
3. Graphical Capabilities
  - Default graph is histogram of cumulative Observed Probability (bar graph) and predicted cumulative NTCP (solid line)
  - Contour plot of predicted NTCP versus selected variables
  - Histogram and Contour plot options are available for binary variables as well

## Examples

### *1. Histogram – Observed vs. Predicted Cumulative NTCP for Binary Variable*

## 2. Contour Plot – Predicted NTCP

### 3. Contour Plots – Predicted NTCP for Binary Variable
